Top 20 Useful HTML Tags & Features -Part-1

1️⃣ `<form>` – Data sender

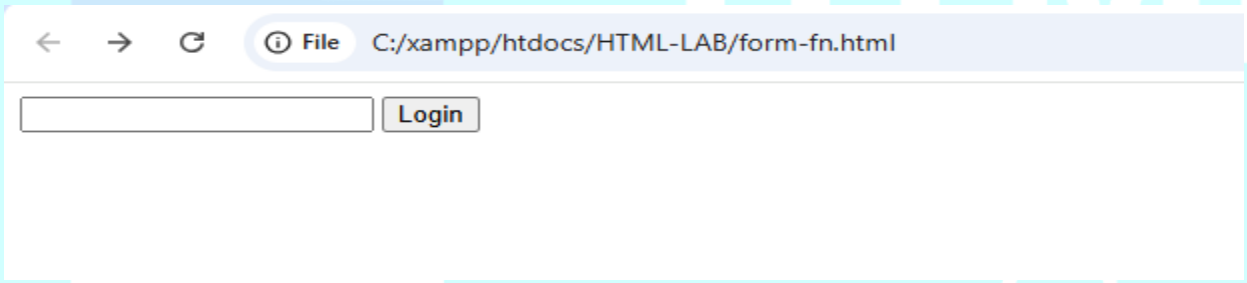
`<form>` tags to collect and submit user data to a server

Syntax

```
<form action="/login" method="POST">
  <input name="user">
  <button>Login</button>
</form>
```

Output

➡ Login form appears
➡ Data sent to server



🔐 **Security:** Input goes to backend → SQLi, brute-force target

Example:

1. User types "**Ram**" in the text field
2. Clicks the "**Login**" button
3. Browser sends this **POST** request to the server:

```
POST /login HTTP/1.1
Content-Type: application/x-www-form-urlencoded

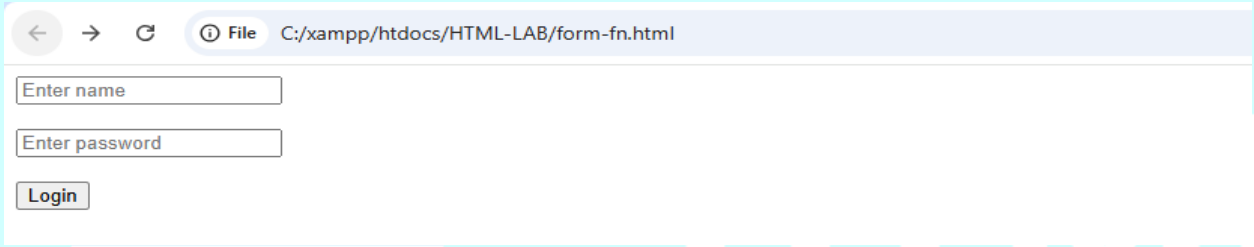
user=Ram
```

4. Server receives this data at the `/login` endpoint

2 <input type="text">

<input> is an HTML element that collects user data like text or passwords and sends it to the server for processing.

```
<form>
  <input type="text" name="user" placeholder="Enter name"><br><br>
  <input type="password" name="password" placeholder="Enter
password"><br><br>
  <button>Login</button>
  </form>
```



1. User Interaction

- User types "Ram" in first field
- User types "secret123" in password field
- User clicks "Login" button

2. Browser Process

1. Form Validation: Browser checks required fields
2. Data Encoding: Converts form data to URL format
3. Request Creation: Prepares HTTP POST request

3. HTTP Request Sent

```
POST /login HTTP/1.1
Host: example.com
Content-Type: application/x-www-form-urlencoded
Content-Length: 29

user=Ram&password=secret123
```

4. Server Processing

- Receives at `/login` endpoint
- Parses `user=Ram` and `password=secret123`
- Validates credentials in database
- Responds with success/failure page

5. Browser Response

- Receives server response (HTML page)
- Renders new page to user
- Redirects to dashboard or shows error

Complete Flow: User Input → Browser Encoding → HTTP Request → Server Processing → Response → Browser Display

`<input type="password">`

```
<input type="password" name="password">
```

Output

➡ Dots instead of characters

🔐 **Security:** **Masking** ≠ encryption

`<button>`

```
<button type="submit">Submit/Login</button>
```

Output

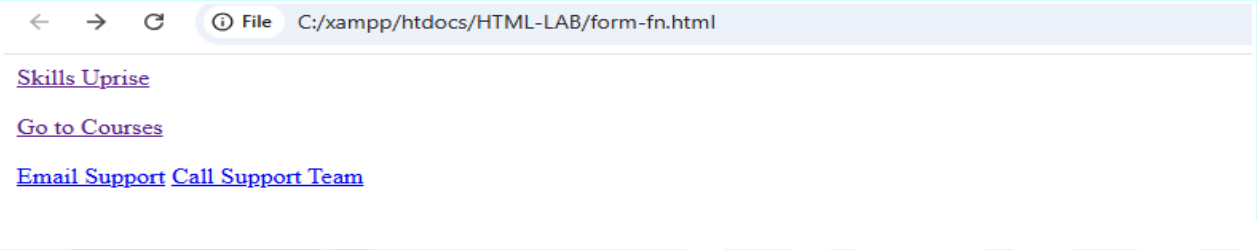
➡ Click sends request

🔐 **Security:** Triggers HTTP request

3 `<a href>`

<a href> creates clickable links in webpages. It connects one page to another or to files/emails.
Users click them to navigate to different locations.

```
a href="https://skillsuprise.com/">Skills Uprise</a><br><br>
  <a href="https://skillsuprise.com/courses">Go to Courses</a>
  <a href="mailto:support@example.com">Email Support</a>
  <a href="tel:+111134567890">Call support Team</a>
```



4 <script>

<script> tag adds JavaScript to webpages to make them do things like popups, animations, and form checks.

```
<script>alert("It's a Trap")</script>
```

1. Shows Popup Alert: When this code runs, a browser popup appears with the message "It's a Trap"
2. Common XSS Attack: This is a basic example of a Cross-Site Scripting (XSS) payload used in security testing
